SUBSTITUTED PYRAZOLYL BENZENESULFONAMIDES  
FOR THE TREATMENT OF INFLAMMATION

FIELD OF THE INVENTION

5 This invention is in the field of anti-inflammatory pharmaceutical agents and specifically relates to compounds, compositions and methods for treating inflammation and inflammation-associated disorders, such as arthritis.

10

BACKGROUND OF THE INVENTION

Prostaglandins play a major role in the inflammation process and the inhibition of prostaglandin production, especially production of PGG<sub>2</sub>, PGH<sub>2</sub> and PGE<sub>2</sub>, has been a common target of anti-inflammatory drug discovery. However, common non-steroidal anti-inflammatory drugs (NSAIDs) that are active in reducing the prostaglandin-induced pain and swelling associated with the inflammation process are also active in affecting other prostaglandin-regulated processes not associated with the inflammation process. Thus, use of high doses of most common NSAIDs can produce severe side effects, including life threatening ulcers, that limit their therapeutic potential. An alternative to NSAIDs is the use of corticosteroids, which have even more drastic side effects, especially when long term therapy is involved.

Previous NSAIDs have been found to prevent the production of prostaglandins by inhibiting enzymes in the human arachidonic acid/prostaglandin pathway, including the enzyme cyclooxygenase (COX). The recent discovery of an inducible enzyme associated with inflammation (named "cyclooxygenase II (COX II)" or "prostaglandin G/H synthase II") provides a viable target of inhibition which more effectively reduces inflammation and produces fewer and less drastic side effects.

Pyrazoles have been described for use in the treatment of inflammation. U.S. Patent No. 5,134,142 to Matsuo et al describes 1,5-diaryl pyrazoles, and specifically, 1-(4-fluorophenyl)-5-[4-(methylsulfonyl)phenyl]-3-trifluoromethyl pyrazole, as having anti-inflammatory activity.

U.S. Patent No. 3,940,418 to R. Hamilton describes tricyclic 4,5-dihydrobenz[g]indazoles as antiinflammatory agents. In addition, R. Hamilton [J. Heterocyclic Chem., 13, 545 (1976)] describes tricyclic 4,5-dihydrobenz[g]indazoles as antiinflammatory agents. U.S. Patent No. 5,134,155 describes fused tricyclic pyrazoles having a saturated ring bridging the pyrazole and a phenyl radical as HMG-CoA reductase inhibitors. European publication EP 477,049, published Mar. 25, 1992, describes [4,5-dihydro-1-phenyl-1H-benz[g]indazol-3-yl]amides as having antipsychotic activity. European publication EP 347,773, published Dec. 27, 1989, describes [4,5-dihydro-1-phenyl-1H-benz[g]indazol-3-yl]propanamides as immunostimulants. M. Hashem et al [J. Med. Chem., 19, 229 (1976)] describes fused tricyclic pyrazoles, having a saturated ring bridging the pyrazole and a phenyl radical, as antibiotics.

---

Certain substituted pyrazolyl-benzenesulfonamides have been described in the literature as synthetic intermediates. Specifically, 4-[5-(4-chlorophenyl)-3-phenyl-1H-pyrazol-1-yl]benzenesulfonamide has been prepared from a pyrazoline compound as an intermediate for compounds having hypoglycemic activity [R. Soliman et al, J. Pharm. Sci., 76, 626 (1987)]. 4-[5-[2-(4-Bromophenyl)-2H-1,2,3-triazol-4-yl]-3-methyl-1H-pyrazol-1-yl]benzenesulfonamide has been prepared from a pyrazoline compound and described as potentially having hypoglycemic activity [H. Mokhtar, Pak. J. Sci. Ind. Res., 31, 762 (1988)]. Similarly, 4-[4-bromo-5-[2-(4-chlorophenyl)-2H-1,2,3-triazol-4-yl]-3-

methyl-1*H*-pyrazol-1-yl]benzenesulfonamide has been prepared [H. Mokhtar et al, *Pak. J. Sci. Ind. Res.*, **34**, 9 (1991)].

The phytotoxicity of pyrazole derivatives is  
5 described [M. Cocco et al, *Il. Farmaco-Ed. Sci.*, **40**, 272 (1985)], specifically for 1-[4-(aminosulfonyl)phenyl]-5-phenyl-1*H*-pyrazole-3,4-dicarboxylic acid.

The use of styryl pyrazole esters for  
10 antidiabetes drugs is described [H. Mokhtar et al, *Pharmazie*, **33**, 649-651 (1978)]. The use of styryl pyrazole carboxylic acids for antidiabetes drugs is described [R. Soliman et al, *Pharmazie*, **33**, 184-5 (1978)]. The use of 4-[3,4,5-trisubstituted-pyrazol-1-yl]benzenesulfonamides as  
15 intermediates for sulfonylurea anti-diabetes agents is described, and specifically, 1-[4-(aminosulfonyl)phenyl]-3-methyl-5-phenyl-1*H*-pyrazole-4-carboxylic acid [R. Soliman et al, *J. Pharm. Sci.*, **72**, 1004 (1983)]. A series of 4-[3-substituted methyl-5-phenyl-1*H*-pyrazol-1-  
20 yl]benzenesulfonamides has been prepared as intermediates for anti-diabetes agents, and more specifically, 4-[3-methyl-5-phenyl-1*H*-pyrazol-1-yl]benzenesulfonamide [H. Feid-Allah, *Pharmazie*, **36**, 754 (1981)]. In addition, 1-(4-[aminosulfonyl]phenyl)-5-phenylpyrazole-3-carboxylic acid  
25 has been prepared from the above described 4-[3-methyl-5-phenyl-1*H*-pyrazol-1-yl]benzenesulfonamide compound [R. Soliman et al, *J. Pharm. Sci.*, **70**, 602 (1981)].

All of these salts may be prepared by conventional means from the corresponding compound of Formula I by reacting, for example, the appropriate acid or base with the compound of Formula I.

GENERAL SYNTHETIC PROCEDURES

The compounds of the invention can be synthesized according to the following procedures of  
 5 Schemes I-VIII, wherein the R<sup>1</sup>-R<sup>7</sup> substituents are as defined for Formula I, above, except where further noted.

**SCHEME I**

10

4

5

Synthetic Scheme I shows the preparation of tetr subsituted pyrazoles from starting material 1. In step 1 of synthetic Scheme I, the phenyl-methyl ketone (1) is treated with a base and an alkylating reagent (R<sup>3</sup>X, where X represents a leaving group such as tosyl) to give the substituted ketone (2). In step 2, the substituted ketone (2) is treated with base, such as sodium methoxide, and an acylating reagent such as an ester (R<sup>2</sup>CO<sub>2</sub>CH<sub>3</sub>), or  
 15 ester equivalent (R<sup>2</sup>CO-imidazole, to give the intermediate  
 20

diketone (3) in a procedure similar to that developed by Reid and Calvin, *J. Amer. Chem. Soc.*, 72, 2948-2952 (1950). In step 3, the diketone (3) is reacted with a substituted hydrazine in acetic acid or an alcoholic solvent to give a mixture of pyrazoles (4) and (5). Separation of the desired pyrazole (4) can be achieved by chromatography or recrystallization.

### SCHEME II

10

Synthetic Scheme II shows the preparation of compounds embraced by Formula I, where R<sup>3</sup> is a hydrogen atom. In step 1, ketone (1) is treated with a base, preferably NaOMe or NaH, and an ester, or ester equivalent, to form the intermediate diketone (6) which is used without further purification. In step 2, diketone (6) in an anhydrous protic solvent, such as absolute ethanol or acetic acid, is treated with the hydrochloride salt or the

free base of a substituted hydrazine at reflux for 10 to 24 hours to afford a mixture of pyrazoles (7) and (8). Recrystallization from diethyl ether/hexane or chromatography affords (7), usually as a light yellow or 5 tan solid.

### Scheme III

10

11

12

Synthetic Scheme III shows the procedure for preparation of 4,5-dihydrobenz[g]indazole compounds embraced by Formula I. In step 1, ethyl trifluoroacetate is reacted with base, such as 25% sodium methoxide in a protic solvent, such as methanol, and a 1-tetralone derivative (9) to give the intermediate diketone (10). In step 2, the diketone (10) in an anhydrous protic solvent, such as absolute ethanol or acetic acid, is treated with the free base or hydrochloride salt of a substituted hydrazine at 15

reflux for 24 hours to afford a mixture of pyrazoles (11) and (12). Recrystallization gives the 4,5-dihydro benz[g]indazolyl-benzenesulfonamide (11).

5

**Scheme IV**

Synthetic Scheme IV shows the preparation of  
10 pyrazole compounds (13), where R<sup>3</sup> is chlorine, from the available pyrazole compounds (7), where R<sup>3</sup> is hydrogen. Chlorination results from passing a stream of chlorine gas at room temperature through a solution containing (7).

15

**Scheme V**

Synthetic Scheme V shows the preparation of substituted ketones 18 which are not commercially available as used in Scheme I. The ketones can be prepared by standard Friedel-Craft acylation of the starting 5 substituted benzenes 14 with acid chlorides or anhydrides 15. Alternatively, the ketones can be prepared from phenylcarbonitriles 16 by standard organometallic techniques where M represents metals such as lithium, magnesium, and the like. An alternative organometallic 10 route is shown from the aldehydes 17 where M represents metals such as lithium, magnesium, and the like. Oxidation with a suitable oxidizing agent, such as  $\text{CrO}_3$ , follows to produce the ketones.

15

### Scheme VI

21

Synthetic Scheme VI shows an alternative 20 regioselective method of constructing the pyrazole 21. Commercially available enones 19 can be epoxidized to give epoxyketones 20, which are treated with 4-sulfonamidophenylhydrazine hydrochloride to provide the pyrazole 21.

25

**Scheme VII**

5         Synthetic Scheme VII shows the preparation of  
pyrazoles **23** (where  $R^4$  is 3-amino-4-substituted phenyl)  
from starting material **22**. Appropriate 5-(4-substituted  
10 aryl)pyrazoles can be nitrated next to the R-group under  
standard nitration conditions and the nitro group reduced  
to the amino group, preferably with hydrazine and Pd/C.  
The amino compounds can be further manipulated by  
alkylation of the amino group.

**Scheme VIII**

Synthetic Scheme VIII shows the preparation of pyrazoles 26 from esters 24. Reduction of the ester 24 to the alcohol, preferably with lithium aluminum hydride (LAH) followed by oxidation, preferably with MnO<sub>2</sub>, gives the 5 aldehyde 25. Various nucleophiles (such as hydroxamates and 1,3-dicarbonyl compounds) can be condensed with the aldehyde to give the desired oximes or olefins 26.

The following examples contain detailed 10 descriptions of the methods of preparation of compounds of Formulas I-II. These detailed descriptions fall within the scope, and serve to exemplify, the above described General Synthetic Procedures which form part of the invention. These detailed descriptions are presented for illustrative 15 purposes only and are not intended as a restriction on the scope of the invention. All parts are by weight and temperatures are in Degrees centigrade unless otherwise indicated. HRMS is an abbreviation for High resolution mass spectrometry. In the following tables, "ND" represents "not 20 determined".

## Example 1

1*H*-pyrazol-1-yl]benzenesulfonamide

Step 1: Preparation of 4,4-difluoro-1-[4-(chlorophenoxy]butane-1,3-dione.

10           Ethyl difluoroacetate (24.82 g, 200 mmol) was placed in a 500 mL three-necked round bottom flask, and dissolved in diethyl ether (200 mL). To the stirred solution was added 25% sodium methoxide in methanol (48 mL, 210 mmol) via an addition funnel over a 2 minute period. Next, 4'-chloroacetophenone (25.94 g, 200 mmol) was dissolved in diethyl ether (50 mL), and added to the reaction dropwise over 5 minutes. After stirring overnight (18 hours), 1N HCl (250 mL) and ether (250 mL) were added. The organic layer was collected, washed with brine (250 mL), dried over MgSO<sub>4</sub>, filtered, and concentrated *in vacuo* to give 46.3 g of a yellow solid. The solid was recrystallized from methylene chloride and iso-octane to give 31.96 g (69%) of the dione: mp 65-66.5°C.

**4-[5-(3-Fluoro-4-methoxyphenyl)-3-(difluoromethyl)-1*H*-pyrazol-1-yl] benzenesulfonamide**

20 Step 1: Preparation of 3'-fluoro-4'-methoxyacetophenone.

Aluminum chloride (80.0 g, 0.6 mol) and chloroform (750 mL) were placed in a 2 L three-necked round 25 bottom flask fitted with a mechanical stirrer and cooled by means of an ice bath. To the stirred solution acetyl chloride (51.0 g, 0.65 mol) was added dropwise, maintaining the temperature between 5-10°C. The mixture was stirred for 10 minutes at 5°C before the dropwise addition at 5-10°C of 30 2-fluoroanisole (62.6 g, 0.5 mol). The mixture was stirred at 0-10°C for 1 hour and poured into ice (1 L). The resultant layers were separated and the aqueous layer was extracted with dichloromethane (2x250 mL). The combined

organic layers were washed with water (2x150 mL), dried over anhydrous MgSO<sub>4</sub>, filtered and concentrated *in vacuo* to a volume of 300 mL. Hexanes were added and a white solid formed which was isolated by filtration and air dried. This

30                  **Methyl 1-(4-aminosulfonylphenyl)-5-(3,5-difluoro-4-methoxyphenyl)-1*H*-pyrazole-3-carboxylate**

Step 1. Preparation of 3,5-difluoro-4-methoxyacetophenone.

To a stirred suspension of AlCl<sub>3</sub> (24.05 g, 180.40 mmol) in chloroform (300 mL, dried by passage through alumina) at 4°C (ice bath) under nitrogen was added acetyl chloride (11.0 mL, 152.65 mmol) over 20 minutes. This chilled suspension was stirred at 0°C for 30 minutes and 2,6-difluoro anisole was added dropwise over 30 minutes.

10 The resulting suspension was warmed to room temperature and stirred overnight. The reaction was quenched by slowly pouring it into a rapidly stirred ice/water mixture. The water layer was extracted with methylene chloride (2x50 mL) and the organic phases were combined and concentrated *in vacuo* yielding a clear mobile oil. In a 50 mL round bottomed flask was added the above clear oil, DMF (25 mL), K<sub>2</sub>CO<sub>3</sub> (15 g). Methyl iodide (6 mL) was added and the suspension stirred at 45°C under nitrogen overnight. Water (1 mL) was added and the mixture was heated for an additional 14 hours.

20 The crude reaction mixture was cooled to room temperature, diluted with water (250 mL) and extracted with diethyl ether (3x100 mL). The ether phase was washed with sodium bicarbonate saturated solution, potassium bisulfate (0.1 N solution), dried over MgSO<sub>4</sub>, filtered and concentrated *in vacuo* yielding a clear mobile liquid. This liquid was distilled (30°C, 1 mm) yielding 12.5 g of a clear liquid which was a mixture of 3,5-difluoro-4-methoxyacetophenone and 3,5-difluoro-4-acetoxyacetophenone in an 85:15 ratio. The yield based upon this ratio was 41%. This ketone was used as is.

A dry 100 ml three-neck flask, equipped with a reflux condenser, thermometer, pressure-equalizing addition 10 funnel and provisions for magnetic stirring was charged with anhydrous DMF (20 mL) and cooled to 0°C. Oxalyl chloride (0.530 mL, 6.105 mmol) was added over twenty seconds, causing a 5°C exotherm. The white precipitate formed dissolved as the reaction cooled to 0°C. The 15 reaction was held at 0°C for ten minutes, then a solution of [1-(4-aminosulfonylphenyl)-5-(4-fluorophenyl)-1H-pyrazol-3-yl]carboxamide (Example 97) in anhydrous DMF was added to the vigorously stirring solution over approximately two minutes. After fifteen minutes, pyridine 20 (1.0 mL, 12.21 mmol) was added to quench the reaction. The mixture was poured into dilute hydrochloric acid (1N, 100 mL) and extracted with ethyl acetate (2x75 mL). The combined organic solution was washed with 1N HCl (2x100 mL) and with 50% saturated NaCl (3x100 mL). The organic 25 solution was dried over magnesium sulfate, filtered and concentrated in vacuo to a crude oil. The oil was applied to a column of silica gel and eluted with ethyl acetate and hexane (40% ethyl acetate) to obtain, upon concentration of the appropriate fractions, 0.66 g (69%) of 4-[3-cyano-5-(4- 30 fluorophenyl)-1H-pyrazol-1-yl]benzenesulfonamide as a white solid: mp 184-185°C; <sup>1</sup>H NMR (CDCl<sub>3</sub>/300MHz) 7.94 (d, J=8.86

### Example 261

#### 4-[1-(4-Fluorophenyl)-3-(trifluoromethyl)-1H-pyrazol-5-yl]benzenesulfonamide

Step 1: Preparation of N,N-bis(4-methoxybenzyl)-4-(aminosulfonyl)acetophenone.

20

To a solution of 4-(aminosulfonyl)acetophenone (2.0g, 9.0 mmol) in dimethylsulfoxide (25 mL) was added sodium hydride (450 mg, 19.0 mmol). The reaction mixture was stirred for 45 minutes and then 4-methoxybenzyl bromide (3.5 g, 19.0 mmol) in dimethylsulfoxide (5 mL) was added via cannula. The mixture was stirred at room temperature for 24 hours and partitioned between ethyl acetate and pH 7 buffer. The aqueous solution was extracted with ethyl acetate. The organic solution was dried ( $MgSO_4$ ) and concentrated. The residue was chromatographed on silica (2:1 hexane:ethyl acetate) to give the desired product (815 mg, 21%).

Step 2: Preparation of N,N-bis(4-methoxybenzyl)-4-[1-(4-fluorophenyl)-3-trifluoromethyl-1H-pyrazol-5-yl]benzenesulfonamide

5

To a 25% sodium methoxide solution in methanol (0.2 mL) was added ethyl trifluoroacetate (75 mg, 0.53 mmol) and the protected acetophenone from Step 1 (235 mg, 0.53 mmol). THF (0.5 mL) was added and the reaction mixture was heated at reflux for 2 hours and then stirred at room temperature overnight. The mixture was partitioned between ether and 1N HCl solution. The organic solution was dried and concentrated to give the crude diketone (279 mg), which was diluted with absolute ethanol (2.5 mL). To this slurry was added pyridine (49 mg, 0.62 mmol) and 4-fluorophenylhydrazine hydrochloride (80 mg, 0.50 mmol). The mixture was stirred at room temperature for 24 hours and concentrated *in vacuo*. The residue was dissolved in methylene chloride and washed with 1N HCl. The organic solution was dried and concentrated. The residue was chromatographed on silica (3:1 hexane:ethyl acetate) to give the protected pyrazole (159 mg, 51%).

25 Step 3: Preparation of 4-[1-(4-fluorophenyl)-3-trifluoromethyl-1H-pyrazol-5-yl]benzenesulfonamide.

To a solution of the protected pyrazole (50 mg, 0.08 mmol) in acetonitrile (1 mL) and water (0.3 mL) was added ceric ammonium nitrate (360 mg, 0.65 mmol). The reaction solution was kept at room temperature for 16 hours. The solution was poured into water (15 mL) and extracted with ethyl acetate (2 x 25 mL). The combined extracts were dried ( $MgSO_4$ ) and concentrated. The residue was chromatographed on silica (2:1 hexane:ethyl acetate) to give the desired product (13 mg, 42%):  $^1H$  NMR ( $CD_3OD$ )

### BIOLOGICAL EVALUATION

#### Rat Carrageenan Foot Pad Edema Test

20

The carrageenan foot edema test was performed with materials, reagents and procedures essentially as described by Winter, et al., (*Proc. Soc. Exp. Biol. Med.*, 111, 544 (1962)). Male Sprague-Dawley rats were selected in each group so that the average body weight was as close as possible. Rats were fasted with free access to water for over sixteen hours prior to the test. The rats were dosed orally (1 mL) with compounds suspended in vehicle containing 0.5% methylcellulose and 0.025% surfactant, or with vehicle alone. One hour later a subplantar

injection of 0.1 mL of 1% solution of carrageenan/sterile 0.9% saline was administered and the volume of the injected foot was measured with a displacement plethysmometer connected to a 5 pressure transducer with a digital indicator. Three hours after the injection of the carrageenan, the volume of the foot was again measured. The average foot swelling in a group of drug-treated animals was compared with that of a group of 10 placebo-treated animals and the percentage inhibition of edema was determined (Otterness and Bliven, *Laboratory Models for Testing NSAIDs*, in **Non-steroidal Anti-Inflammatory Drugs**, (J. Lombardino, ed. 1985)). The % inhibition shows the 15 % decrease from control paw volume determined in this procedure and the data for selected compounds in this invention are summarized in Table I.

#### Rat Carrageenan-induced Analgesia Test

20 The analgesia test using rat carrageenan was performed with materials, reagents and procedures essentially as described by Hargreaves, et al., (*Pain*, 32, 77 (1988)). Male Sprague-Dawley rats were 25 treated as previously described for the Carrageenan Foot Pad Edema test. Three hours after the injection of the carrageenan, the rats were placed in a special plexiglass container with a transparent floor having a high intensity lamp as a radiant heat source, 30 positionable under the floor. After an initial twenty minute period, thermal stimulation was begun on either the injected foot or on the contralateral uninjected foot. A photoelectric cell turned off the lamp and timer when light was interrupted by paw 35 withdrawal. The time until the rat withdraws its foot was then measured. The withdrawal latency in seconds was determined for the control and drug-treated

groups, and percent inhibition of the hyperalgesic foot withdrawal determined. Results are shown in Table XI.

#### Evaluation of COX I and COX II activity *in vitro*

30

The compounds of this invention exhibited inhibition *in vitro* of COX II. The COX II inhibition activity of the compounds of this invention illustrated in the Examples was

35 determined by the following methods.

a. Preparation of recombinant COX baculoviruses

A 2.0 kb fragment containing the coding  
5 region of either human or murine COX-I or human or  
murine COX-II was cloned into a BamH1 site of the  
baculovirus transfer vector pVL1393 (Invitrogen) to  
generate the baculovirus transfer vectors for COX-I  
and COX-II in a manner similar to the method of  
10 D.R. O'Reilly et al (*Baculovirus Expression*  
*Vectors: A Laboratory Manual* (1992)). Recombinant  
baculoviruses were isolated by transfecting 4 µg of  
baculovirus transfer vector DNA into SF9 insect  
cells (2x10e8) along with 200 ng of linearized  
15 baculovirus plasmid DNA by the calcium phosphate  
method. See M.D. Summers and G.E. Smith, *A Manual*  
*of Methods for Baculovirus Vectors and Insect Cell*  
*Culture Procedures*, Texas Agric. Exp. Station Bull.  
1555 (1987). Recombinant viruses were purified by  
20 three rounds of plaque purification and high titer  
(10E7 - 10E8 pfu/ml) stocks of virus were prepared.  
For large scale production, SF9 insect cells were  
infected in 10 liter fermentors (0.5 x 10<sup>6</sup>/ml) with  
the recombinant baculovirus stock such that the  
25 multiplicity of infection was 0.1. After 72 hours  
the cells were centrifuged and the cell pellet  
homogenized in Tris/Sucrose (50 mM: 25%, pH 8.0)  
containing 1% 3-[ (3-  
cholamidopropyl)dimethylammonio] -1-  
30 propanesulfonate (CHAPS). The homogenate was  
centrifuged at 10,000xG for 30 minutes, and the  
resultant supernatant was stored at -80°C before  
being assayed for COX activity.

b. Assay for COX I and COX II activity:

COX activity was assayed as PGE<sub>2</sub> formed/ $\mu$ g protein/time using an ELISA to detect the prostaglandin released. CHAPS-solubilized insect cell membranes containing the appropriate COX enzyme were incubated in a potassium phosphate buffer (50 mM, pH 8.0) containing epinephrine, phenol, and heme with the addition of arachidonic acid (10  $\mu$ M). Compounds were pre-incubated with the enzyme for 10-20 minutes prior to the addition of arachidonic acid. Any reaction between the arachidonic acid and the enzyme was stopped after ten minutes at 37°C/room temperature by transferring 40  $\mu$ l of reaction mix into 160  $\mu$ l ELISA buffer and 25  $\mu$ M indomethacin. The PGE<sub>2</sub> formed was measured by standard ELISA technology (Cayman Chemical). Results are shown in Table XII.

Also embraced within this invention is a class of pharmaceutical compositions comprising one or more compounds of Formula I in association with one or more non-toxic, pharmaceutically acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and, if desired, other active ingredients. The compounds of the present invention may be administered by any suitable route, preferably in the form of a pharmaceutical composition adapted to such a route, and in a dose effective for the treatment intended. The compounds and composition may, for example, be administered intravascularly,

intraperitoneally, subcutaneously, intramuscularly or topically.

For oral administration, the pharmaceutical 5 composition may be in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are tablets or 10 capsules. The active ingredient may also be administered by injection as a composition wherein, for example, saline, dextrose or water may be used as a suitable carrier.

15 The amount of therapeutically active compound that is administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical 20 condition of the subject, the severity of the disease, the route and frequency of administration, and the particular compound employed, and thus may vary widely. The pharmaceutical compositions may contain active ingredient in the range of about 0.1 to 2000 mg, 25 preferably in the range of about 0.5 to 500 mg and most preferably between about 1 and 100 mg. A daily dose of about 0.01 to 100 mg/kg body weight, preferably between about 0.1 and about 50 mg/kg body weight and most preferably from about 1 to 20 mg/kg body weight, may be 30 appropriate. The daily dose can be administered in one to four doses per day.
